The TeraSci Approach

In 1996 after 25 years of experience in the computer industry mostly based on storage systems AI and Mark Donnelly incorporated TeraSci. The focus was on fully turnkey automated test solutions. To provide a low cost high volume process these systems were tightly integrated with both a database and the internet. We now have almost 25 years of experience, software development, and equipment designs based on a data analysis driven test systems. This coupled with full remote control of all of our worldwide systems means we can provide the highest quality test processes in the industry. This can be from a very small test site on any continent to the largest test processing facilities. All of our worldwide equipment is connected to our database at our headquarters and uploads test results in real time. We have always believed that

our database analysis systems allow us to be proactive rather than a reactive solution.

We only lease our test solutions. The electronics industry is a very fast paced environment and with the rapid changes; equipment and software must be constantly upgraded. The lease approach means you have a very low cost of entry, no big capital expenditure and no software development to get started. As your volumes change (up or down) you can change the mix of equipment on lease. It is our responsibility to keep you at the latest technology level. You have a fixed lease cost per test unit and we provide all of the hardware, software spares and service at no additional cost.

TeraSci Sales and Service

We use our industry standard test systems to provide an in house service for your one time or low volume test requirements.

Our sales department can procure parts and we test them with our equipment to provide fully qualified replacement parts. When you buy from TeraSci you are getting fully recertified parts that meet the specifications of the original provider.
